

Unified Maintenance Hub 2.0 (UMH2.0): Mobile Maintenance Application

Company: ST Engineering / MichaelPage

Unified Maintenance Hub 2.0 (UMH2.0) is an enterprise mobile maintenance application developed for Singapore's Land Transport Authority (LTA). The application enables field engineers and maintenance personnel to manage work orders, perform preventive and corrective maintenance, report infrastructure faults, inspect assets, and synchronize data with centralized maintenance systems. The solution supports offline operation, GPS location services, RFID/NFC and QR code scanning, photo attachments, and secure enterprise authentication for road infrastructure and intelligent transport systems.

Role: Assistant Principal Engineer / Senior Software Engineer

Platform: Android Java

Project Type: Enterprise Asset Management & Infrastructure Maintenance System / Government / Field Service

Key Contributions

- * Developed and implemented enterprise mobile features for Android and iOS throughout the software development lifecycle, from design and development to deployment and production support.
- * Designed and implemented offline data synchronization between mobile devices and centralized maintenance systems using IBM MobileFirst.
- * Developed work order management modules supporting preventive, corrective, and ad-hoc maintenance activities.
- * Implemented GPS, map integration, geo-fencing, RFID/NFC, barcode and QR code scanning for asset identification and field operations.
- * Integrated RESTful APIs with enterprise backend systems for work orders, asset management, authentication, notifications, and data synchronization.
- * Developed photo attachment, fault reporting, inspection, and asset management features used by field maintenance engineers.
- * Collaborated with business analysts, backend developers, QA engineers, and project stakeholders within an Agile development environment.

Key Features

Work Order Management, Preventive Maintenance, Corrective Maintenance, Asset Management, Fault Reporting, Offline Synchronization, GPS & Maps, Geo-fencing, RFID/NFC Scanning, Barcode & QR Code Scanning, Photo Attachments, IBM MobileFirst, REST APIs, Enterprise Authentication

HerdPlus: Easy Attendance

Company: HerdHR Private Limited

HerdPlus is the next-generation HR workforce management application built using Flutter as the modern successor to the Herd Suite mobile applications. The app combines employee attendance, leave management, workforce access, and self-service features into a single platform with an updated user interface and improved cross-platform support. It allows employees to clock in using QR code or selfie attendance, apply for leave, manage multiple work locations, and access workforce information through a centralized mobile application.

Role: Mobile Developer

Platform: Android / iOS (Flutter)

Project Type: Enterprise Human Resource Information System (HRIS)

Key Contributions

- * Developed and implemented the Flutter version of the Herd Suite mobile application while modernizing the existing Android and iOS solution.
- * Designed the application architecture, system design, implementation, testing, production deployment, and ongoing maintenance.
- * Migrated and enhanced existing workforce management features from the previous native applications into a unified Flutter application.
- * Implemented QR code attendance, selfie attendance verification, multi-location support, employee directory, leave management, and workforce access features.
- * Integrated the application with backend HR and attendance services through RESTful APIs.
- * Worked closely with backend developers, QA engineers, UI/UX designers, and business stakeholders throughout the software development lifecycle.

Key Features

QR Code Attendance, Selfie Attendance Verification, Multi-location Support, Employee Directory, Leave Management, Workforce Access, Flutter, REST APIs, Camera API, Location GPS, Cross-platform Mobile Development

Herd Manage: Review On-The-Go

Company: HerdHR Private Limited

Herd Manage is an HR mobile workforce management application designed for supervisors and managers to monitor daily workforce activities and manage employee attendance. The app provides a centralized dashboard for reviewing timesheets, approving leave requests, monitoring missing employees, tracking workforce availability, and reviewing employee notes. Aims to help managers make timely decisions while staying connected to their teams in real time.

Role: Mobile Developer

Platform: Android Java iOS

Project Type: Enterprise HR / Workforce Management App

Key Contributions

- * Designed, developed, and implemented the application from start to finish, including requirements gathering, documentation, development, testing, production deployment, and ongoing maintenance.
- * Designed and implemented the data synchronization algorithm between the mobile application and backend server database to ensure updated workforce data.
- * Developed manager dashboards for monitoring employee attendance, workforce status, and operational activities.
- * Implemented leave request approval, timesheet review, workforce monitoring, employee notes, and attendance management features.
- * Integrated the application with backend HR and workforce management services through RESTful APIs.
- * Collaborated with backend developers, QA engineers, UI/UX designers, and key business stakeholders throughout the software development lifecycle.

Key Features

Hilfritz Camallere

Herd Me: Work Life Coordinator

Company: HerdHR Private Limited

Herd Me is an HR employee self-service mobile application that provides employees with convenient access to their HR information and daily work activities. The app allows users to view payslips, apply for leave, review work schedules and timesheets, receive notifications, and stay connected with their organization from anywhere. It serves as a centralized platform for employees to manage their employment information and HR-related tasks.

Role: Mobile Developer

Platform: Android Java / iOS

Project Type: Enterprise HR / Workforce Management App

Key Contributions

- * Designed, developed, and implemented the application from start to finish, including requirements gathering, documentation, development, testing, production deployment, and ongoing maintenance.
- * Designed and implemented the data synchronization algorithm between the mobile application and backend server database.
- * Developed employee self-service features including payslip viewing, leave application, work schedule, timesheet tracking, and notifications.
- * Implemented employee profile management, leave request submission, and document retrieval features.
- * Integrated the application with backend HR and payroll services through RESTful APIs.
- * Collaborated with backend developers, QA engineers, UI/UX designers, and business stakeholders throughout the software development lifecycle.

Key Features

Employee Dashboard, Payslip Viewing, Leave Application, Work Schedule, Timesheet Tracking, Push Notifications, Employee Self-Service, HR & Payroll Integration

Herd Time: Photo Attendance

Company: HerdHR Private Limited

Herd Time is a HR mobile attendance and workforce time-recording application designed for employees and managers. The app allows users to log work, break, travel, and meeting attendance with location-based support. Employees can record their own attendance, while managers can use the app as a centralized time recorder as a Kiosk for staff in a specific location. It also supports selfie-based attendance confirmation, daily timesheet tracking, and work notes with photo attachments.

Role: Mobile Developer

Platform: Android Java / iOS

Project Type: Enterprise HR / Workforce Management App

Key Contributions

- * Designed, developed and implemented the application end to end, including from requirements gathering, system design, documentation, coding, production deployment up to maintenance.
- * Designed and implemented the data synchronization algorithm between the mobile application and backend server database to ensure reliable online and offline synchronization.
- * Worked on location-based time recording features.
- * Implement selfie/photo confirmation for attendance, note taking feature, location update feature etc.
- * Integrated app features with backend HR/timekeeping.

Key Features

Location GPS, Notification, Camera API, REST APIs, Java, AndroidSDK, Swift, SwiftUI, SQLite, Git
